The product is a significant upgrade of the original AutoCAD software that helps you save time and effort in creating your own business and personal designs. AutoCAD Student Edition includes all the same features as the original AutoCAD and does not require the purchase of any software, apart from any software required to run your computer system. This includes AutoCAD, the operating system and any other software applications that you may already have installed. The Student Edition product is supported by a range of activities to assist you in your training, including:

- Instructor-led classroom training for groups of students.
- Individualized self-learning courses (including live or recorded web seminars).
- Recorded web seminars.
- AutoCAD Certification for AutoCAD Level I and II professionals and Authorized Software Users.

Check out the features of AutoCAD Student Edition here. Certification for AutoCAD Level I and II professionals and Authorized Software Users A series of certification courses for AutoCAD Level I and II professionals have been introduced to ensure your skills are kept up to date. AutoCAD Level I and II certifications focus on the design and drafting of 2D (sheet metal, piping, mechanical) and 3D objects (cubic, solid, surface) as well as a range of drawing and text objects. The AutoCAD Level I certification focuses on 2D objects. The AutoCAD Level II certification focuses on 3D objects. AutoCAD Level I & II: AutoCAD Authorized Software Users Those who use the AutoCAD software regularly can obtain the AutoCAD Authorized Software Users Certification. This is available for AutoCAD Level I and II users. The AutoCAD Authorized Software Users certification is the first of its kind and is designed to ensure that AutoCAD users have demonstrated the skills required to maintain and develop their skills. It includes the following activities:

- An assessment test to ensure you are familiar with the features of the software application, including its user interface and commands.

The present invention relates to a new and distinctive soybean cultivar, designated S110118. All publications cited in this application are herein incorporated by reference. There are numerous steps in the development of any novel, desirable plant germplasm. Plant breeding begins with the analysis and definition of problems and weaknesses of the current germplasm, the establishment of program goals, and the definition of specific breeding objectives. The next step is selection of germplasm that possesses the traits to meet the program goals. The goal is to combine in a single cultivar an improved combination of desirable traits from the parental germplasm. These important traits may include, but are not limited to, higher seed yield, resistance to diseases and insects, better stems and roots, tolerance to drought and heat, altered fatty acid profile, abiotic stress tolerance, improvements in compositional traits, and better agronomic quality. These processes, which lead to the final step of marketing and distribution, can take from six to twelve years from the time the first cross is made. Therefore, development of new cultivars is a time-consuming process that requires precise forward planning, efficient use of resources, and a minimum of changes in direction. Soybean (*Glycine max*), is an important and valuable field crop. Thus, a continuing goal of soybean plant breeding is to develop stable, high yielding soybean cultivars that are agronomically sound. The reasons for this goal are to maximize the amount of grain produced on the land used and to supply food for both animals and humans. To accomplish this goal, the soybean breeder must select and develop soybean plants that have the traits that result in superior varieties. The soybean is the world's leading source of vegetable oil and protein meal. The oil extracted from soybeans is used for cooking oil, margarine, and salad dressings. Soybean oil is composed of saturated, monounsaturated, and polyunsaturated fatty acids. It has a typical composition of 11% palmitic, 4% stearic, 25% oleic, 50% linoleic, and 9% linolenic fatty acid content ("Economic Implications of Modified Soybean Traits Summary Report," Iowa Soybean Promotion Board and American Soybean Association Special Report 92S (May 1990)). Changes in fatty acid composition for improved oxidative stability and nutrition are constantly sought after. Industrial uses of soybean oil, which is subjected to further processing, include ingredients for paints
