Photoshop Elements also introduced features such as text and the ability to crop images, make images smaller, and make accurate color adjustments. Initially, the software contained a library of photos, elements and others to make working with photos easy. Subsequently, it included features such as watermarks, making regular photos into gallery-ready images, and even non-photo editing capabilities such as merging, brightness and contrast adjustments, and the ability to make adjustments to specific areas of images. Photoshop has greatly increased in popularity since its introduction and its current version is powerful and a popular alternative to Microsoft Office.

## What's New in the Adobe Photoshop CC?

The duo also continued to talk about the past, including how they really found out about their divorce (she heard about it from a television show), how they prepare for a red carpet interview, and that '90s sitcom "Are You There, Chelsea?" that had just recently come back on the air. Speaking of which, please watch the clip from Geller and Gellar's first interview together. It was hysterical. Check out the clip below. "Chelsea Lately" returns to E! next week on Tuesday at 11 p.m. ET.

**Steroidogenic potential of the isolated granulosa cells.**

1. In order to determine the steroidogenic capability of granulosa cells isolated from human preovulatory follicles, the isolated cells were incubated with [3H]-cholesterol and [3H]-progesterone; progesterone formed was shown to be incorporated into the cellular microsomal fraction.
2. The degree of incorporation of both radioactive precursors was biphasic, being highest at the beginning of incubation and decreasing to a lower, but constant level at the end of the incubation.
3. The maximum rate of incorporation of [3H]-progesterone was about 1.7 pmol/10(6) cells/30 min, and approximately 70% of the radioactive progesterone was converted into pregnenolone.
4. The activity of this granulosa cell granulose-cell-derived pregnenolone dehydrogenase was determined in control and atretic granulosa cells.
5. It is concluded that the steroidogenesis of the granulosa cells is biphasic: first, there is an induction of the enzyme with a high proportion of the steroid produced being immediately converted into pregnenolone. Later, the steroidogenic capacity of the cells drops to a lower level where the steroid is progressively converted into other steroid hormones.

There is a critical shortage of postdoctoral physicians and basic scientists to provide patient care, conduct laboratory research and clinical trials, and develop innovative health care solutions for persons with spinal cord injury. The future of research and medicine depends on this generation of new physician scientists (NSP) engaging in high quality patient-oriented research and clinical studies that are integrated into the delivery of modern health care.
