G-code A G-code file is a computer programming language for robots. G-code was created by the late American roboticist George Devol in 1959. G-code is used for defining programs for computers controlled by robots. These programs are called jobs, and the terms file and programming language are often used synonymously. The most basic G-code program is a single line of instructions. This is sometimes called a "job line". A computer may run a G-code file by printing each of the job line instructions one at a time, each as it is issued by the computer. Jobs may be combined to form programs such as a job to shape a particular section of a part, or to move and rotate a whole block. G-code uses the ASCII character set, with the first character being the instruction. The line may have up to three parts: the first part is the input or command, the second is the output or program, and the third part is the control byte. The control byte is an identifier of the operation to be performed. The two most common control bytes are the integer 0x40 (A) for a move operation, and the integer 0x41 (B) for a turn operation. LISP An AUTO CAD program written in LISP was developed by Bob Parsons and published by AutoCAD Crack Keygen's development department. The intent was to provide a programming language and platform for the developers of AUTO CAD extension products. The object-oriented programming language LISP is a descendant of APL, and is more modern than the Lisp implementation in APL. The object-oriented part of the implementation is still referred to as APL. LISP is a collection of functions and some data types that provide the means for describing and manipulating objects in a computer. One of the reasons for creating LISP was that the object-oriented programming features of LISP were seen as the best way to extend AutoCAD Free Download. The ObjectARX LISP implementation for AutoCAD was available starting in AutoCAD 2010 as a programming extension and became available for AutoCAD 2013 as a new API. VBScript VBScript is a programming language designed for Microsoft's Windows operating system. The present invention relates to an improved magnetic tape cassette for use with a drive in which a pair of guide members, which guide the magnetic tape and are spaced apart from each other, move in a plane substantially parallel to the surface of the magnetic tape. The need for compact-sized recording and playback devices in which the relative length of the device itself is not unduly large, such as in the so-called desk-top type recording and playback devices, has become increasingly strong. One such device which is designed to meet this need is an 8-mm type of magnetic tape cassette in which the magnetic tape itself is supported on a hub and which is wound around this hub by a pair of guide rollers. In this arrangement, the pair of guide rollers are spaced apart from each other by a distance corresponding to about one-half of the width of the magnetic tape and the magnetic tape is supported on the pair of guide rollers in a manner that the tape is in contact with both of the pair of guide rollers. In this type of magnetic tape cassette, the pair of guide rollers are disposed on opposite sides of the magnetic tape and are disposed to move in a direction which is substantially parallel to the surface of the magnetic tape and both of these guide rollers move in the same direction at a uniform speed, and the magnetic tape is guided in a uniform direction at a uniform speed. In this construction, since the tape guide arrangement is of a type in which the magnetic tape is supported on two guide rollers spaced apart from each other, it is necessary that the pair of guide
