The liquid crystal display device of the type employing an optical waveguide plate is basically constructed such that an optical waveguide plate is formed on the inner surface of the casing of a device and light which is introduced by a light source provided outside the casing is caused to enter the optical waveguide plate, the light thus entering the optical waveguide plate being led to the display surface of the liquid crystal display device through a light-guiding member provided outside the casing. In the conventional liquid crystal display device of the type described above, the light-guiding member is formed of a member which is substantially transparent and which has its light-transmissive portions which correspond to the pixels of the display surface of the liquid crystal display device, so that light which is emitted from the light source and

OEMs align on industry standard for power-on reset The first significant global standard aimed at limiting power-on-reset (POR) problems in embedded networking equipment is nearly a year old. However, a recent survey confirms that some 80% of OEMs have yet to commit to a standard for handling POR events. In late 2012, the ETSI (European Telecommunications Standards Institute) Computer and Telecommunications Industry Association (CTIA) announced a power-on-reset standard. The standard aims to give the embedded Ethernet community an industry standard they can use to reliably diagnose, identify and track PORs. Tom Bader, vice president of technical marketing for Mellanox Technology, has been working to create a reliable standard for power-on-reset. "A specification has been finalized by the [ETSI technical committee] G2N (High Performance Computing and Networking) and defined as STANAG 4221. There is not yet a manufacturing practice, but we expect one in due course," he said. "The standard is similar to STANAG 4221, but is being marketed through ETSI." Bader also suggested that some OEMs would want to handle PORs in different ways than those outlined in STANAG 4221. "This [CTIA] is a good stop gap for the industry. But, I think it is more of an interim standard where we don't have a final standard," he said. The details of the standard were first outlined in October 2011 in ETSI publication STANAG 5869. The publication explained the problem: "The components on a network switching system generate a P 6d1f23a050
